Feature:

1.The Magic Box is a dedicated audio processing module for remote conference systems. It uses AI artificial intelligence language to complete the echo cancellation algorithm while amplifying local sound. It is suitable for high-quality remote conferences. The automatic gain (AGC) algorithm is used in interactive places. No matter how far or close the speaker is from the microphone, good recording effects can be achieved. It can be used in places that need to meet the requirements of high transmission gain of local sound amplification and high-quality remote conference interaction at the same time

2.Automatic echo cancellation

3.Automatic gain, no matter how far the speaker is, good and clear recording effects can be achieved.

4.Support 2-way MIC/LINE input, 2-way balanced terminal output

5.Use a dedicated power adapter

6.Support monitoring headphone output

7.Support +48V phantom power supply function

8.Support volume addition and subtraction
